Aerial Connections

The Philco High Efficiency Aerial is recommended, for use with this receiver, to obtain maximum performance. A terminal panel is provided at the rear of the chassis for connecting the aerial. This panel contains four screw terminals and a connecting link.

When using the PHILCO HIGH EFFICIENCY AERIAL connect the red and black leads of the Aerial transmission line (lead-in) to terminals 1 and 2 respectively and the ground lead to terminal 3.

If a temporary aerial and ground is used shift the connecting link to rest across terminals 2 and 3 and connect the aerial and ground to terminals 1 and 3 respectively.

REMOVING SWITCH AND COIL ASSEMBLIES FROM R. F. UNIT

Remove the center mounting screw on the rear of the R. F. unit. Then lift the rear of the unit and push forward until the rubber grommet, on each side of the unit, clearing the mounting slots. The unit is then lifted far enough from the chassis for removal of the two screws holding the selector switch indexing plate and shaft (front of the unit) then pull shaft straight out. Removal of the volume control shaft is also necessary.

IMPORTANT—When selector switch shaft is replaced, care should be taken to have all wafer rotors in the same position so that index projection on the end of shaft will slide freely into notched hole in wafer rotors. Never force shaft into rotors.

AERIAL SWITCH AND COIL ASSEMBLY.
FIRST SECTION FROM REAR OF UNIT

a. Remove screw holding shield plate to unit base. This screw is located in the right hand corner of shield plate, facing rear underside of chassis.

b. Unsolder the leads connecting the range switch to the aerial panel and I. F. terminal panel; tubular condenser @ to the tuning condenser stator plate and ground lead from assembly shield to unit frame—lift assembly straight out of unit.

R. F. AMPLIFIER ASSEMBLY, CENTER SECTION

a. Remove screw holding shield plate to unit base.

b. Unsolder the leads connecting the range switch to I. F. terminal panel and 6K7G plate socket contact, tubular condenser @ to the tuning condenser housing, selector switch contact (D2) to the tuning condenser stator plates, tubular condenser @ to shield ground lug and shield to R. F. unit base. The amplifier assembly may then be removed.

OSCILLATOR SWITCH AND COIL ASSEMBLY.
THIRD SECTION FROM REAR OF UNIT

a. The oscillator assembly may now be removed by unscrewing the four screws holding shield to R. F. base. These screws are located on each side of the R. F. base.

b. Unsolder the leads connecting range switch to 6K7G socket contacts and terminal panel in the I. F. unit, condenser @ lead from tuning condenser housing and lead connecting selector switch to the tuning condenser stator plates. Then unsolder wires connecting selector switch to electrolytic condenser @ and 6A8G socket contacts.

Parts are replaced by following the above procedure in the reverse order.

Electrical Specifications

Voltage Rating: 115 A. C.
Frequency Rating: 50 to 60 cycle.
For 25 to 40 cycle operation use Power Transformer marked with asterisk in parts list.
Power Consumption: 80 watts.
Type and Number of Tubes: 2 type 6K7G—R. F. and I. F. Amplifier; 1 type 6A8G—Det. Oscillator; 1 type 6Q7G—2nd Det., 1st Audio, A. V. C.; 2 type 6F6G—Push-pull Output; 1 type 5Y4G—Rectifier.
Undistorted Output: 5 watts.
Intermediate Frequency: 470 K. C.
Tuning Ranges: Three. Range 1—530 to 1720 K. C. Range 2—2.3 to 7.4 M. C. Range 3—7.85 to 22 M. C.
Speakers: K-34 B Cabinet.
H-25 X-MX Cabinet.

Model 37-640 is a 7 tube superheterodyne receiver for operation on alternating current, having three tuning ranges, covering standard broadcast and short-wave frequencies. The chassis is constructed in three basic assembly units, concentrating the R. F., I. F. and Audio Output circuits in individual units.

The circuit consists of the "PHILCO FOREIGN TUNING SYSTEM"—controlled by the range switch—providing maximum sensitivity and noise reduction, when used with the PHILCO HIGH EFFICIENCY AERIAL. One stage of radio frequency amplification which increases the signal to noise ratio, Automatic Bass Compensation in the volume control circuit, Shadow Tuning, a separate diode circuit for the Automatic Volume Control and a push-pull pentode audio output circuit are also incorporated in this receiver.

Fig. 1—Socket Voltages

The voltages indicated by arrows were measured with a Philco 635 Circuit Tester which contains a voltmeter having a resistance of 1000 ohms per volt. Volume Control at minimum, range switch in broadcast position, line voltage 115 A. C.

Model 37-640
Alignment of Compensators

The accurate adjustment of the various compensating condensers is vital to the proper functioning of this receiver. There are four compensating condensers in the I. F. Circuit, four in the Oscillator Circuit, three in the R. F. Amplifier Circuit and three in the Antenna Circuit. Incorrect adjustment will cause loss of sensitivity, unsatisfactory tone, and poor selectivity.

To accurately adjust this receiver, precision test equipment is necessary. A signal generator such as the PHILCO MODEL 088 SIGNAL GENERATOR, covering from 110 to 20,000 K. C. is recommended for adjusting the compensators at the various frequencies specified. A visual indication of the receiver output is also necessary to obtain correct adjustment of the compensators. PHILCO MODEL 025 CIRCUIT TESTER contains a sensitive output meter and is recommended for these adjustments.

Philco Fibre Handle Screw-driver No. 27-7059 completes the necessary equipment for these adjustments. The locations of the various compensators are shown in Figs. 6 and 7.

The following procedure must be observed in adjusting the compensators:

**DIAL CALIBRATION**—In order to adjust this receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this, rotate the tuning condenser control to the extreme counter-clockwise position (maximum capacity). Loosen the screw of dial hub, then turn dial until the glowing indicator is centered on the first index line of dial scale (see Fig. 5). Now tighten the dial hub set screw in this position.

**SHADOW METERADJUSTMENT**—Remove aerial and allow tubes to warm up. Then adjust shadow meter as follows:

1. Move the Shadow meter coil backwards and forwards, until the shadow is centered on the first index line of dial scale (see Fig. 5). Now tighten the dial hub set screw in this position.

2. Replace the Rectifier tube from its socket, and rotate the shadow meter coil for minimum shadow width.

3. Replace the Rectifier tube. The shadow should then return to maximum width or within one-eighth of an inch of each side of the screen. If the shadow does not return to maximum width, operations 1 and 2 should be continued until it does.

**OUTPUT METER**—The 025 Output Meter is connected to the plate and cathode terminals of one (6F6G) tube. Adjust the meter to use the (0-30) Volt Scale.

During the I. F. and R. F. adjustments, the signal generator output should be maintained at the lowest possible level that will give an indication on the output meter.

**INTERMEDIATE FREQUENCY CIRCUIT**

**Frequency 470 K. C.**

1. Connect the 088 Signal Generator output lead, through a .1 mfd. condenser, to the control grid of the 6AG7 tube; and the ground connection of the output lead to the chassis.

2. Set the range switch in position No. 1 (Broadcast). Now rotate the tuning condenser of the receiver to the maximum capacity position (counter-clockwise), and adjust the signal generator for 470 K. C.

3. Adjust condensers @ 2nd I. F. Sec., @ 2nd I. F. Pri., @ 1st I. F. Sec., and @ 1st I. F. Pri. for maximum reading on output meter.

**RADIO FREQUENCY CIRCUIT**

**Tuning Range—7.3 to 22.0 M. C.**

1. Remove the signal generator output lead from the grid of 6A8G tube, and connect it through the .1 mfd. condenser to terminal No. 1 on aerial input panel, and the generator ground lead to terminal No. 4, rear of chassis.

(a) Terminals 2 and 3 of aerial input panel must be connected with connector link provided on the panel, during these adjustments.

2. Set the tuning range switch in position No. 3 (Short Wave). Now rotate the signal generator and receiver dials to 18 M. C. and adjust compensators @ Osc., @b R. F., and @b Ant. for maximum output (see note @a below).

(a) The adjustment of the Radio Frequency compensator on the high frequency range causes a slight detuning of the oscillator circuit. In order to overcome this detuning effect, connect a variable condenser of approximately 350 mfd., having a good vernier drive, across the oscillator section of the tuning condenser. Leaving the signal generator and receiver dials at 18 M. C., tune the added condenser so that the second harmonic of the receiver oscillator will beat against the signal from the 088 signal generator bringing in the signal. The antenna and R. F. compensator @b and @b should then be adjusted to give maximum output. Now remove the external condenser and turn compensator @b to maximum capacity (clockwise) then without moving signal generator or receiver tuning condenser, back off compensator @b (counter-clockwise) until a second peak is reached on the output meter. The peak is caused by tuning to the image frequency signal and must not be used.

**Tuning Range—2.3 to 7.4 M. C.**

1. Turn the range switch to position No. 2 (Police). Now rotate the signal generator and receiver dials to 70 M. C. and adjust compensator @a for maximum output. Now turn the signal generator and receiver dials to 6.0 M. C. and adjust compensators @ Osc. and @a Ant. for maximum reading on output meter.

**Tuning Range—530 to 1720 K. C.**

1. Set the range switch in position No. 1 (Broadcast). Now rotate the 088 Signal Generator indicator at 800 K. C. and the receiver dial at 1600 K. C. (a) In adjusting the receiver at 1600 K. C. the second harmonic of 800 K. C. to which the signal generator is tuned, is used. The second harmonic of 800 K. C. is 1600 K. C. Now adjust compensators @ Osc., @ R. F. and @ Ant. for maximum reading on output meter.

2. The low frequency end of the range is now tuned by turning the signal generator and receiver dials to 600 K. C. Adjust compensator @ Osc. and @ R. F. for maximum output. Now vary the tuning condenser and again vary the tuning condenser back and forth at 600 K. C. for maximum output. This operation of first tuning the compensator then the tuning condenser is continued until maximum output is obtained at the 600 K. C. frequency.

3. After the low frequency (600 K. C.) end of the range is adjusted, the 1600 K. C. end is readjusted, as given in Paragraph (1) above, to correct any variation that the low frequency series compensator may have caused in the alignment of the high frequency end.

4. Now turn the signal generator and receiver dials to 1500 K. C. and readjust compensators @ Ant., and @ R. F., for maximum output.
